AMDA Releases Second Round of Potentially Unnecessary Medical Tests, Procedures as Part of the ABIM Foundation’s Choosing Wisely® Campaign

Louisville, KY – AMDA – The Society for Post-Acute and Long-Term Care Medicine (AMDA) has partnered with the ABIM Foundation’s Choosing Wisely® campaign to encourage discussions among physicians, patients, and other health care stakeholders about medical tests and procedures that may be unnecessary or even cause harm. In September 2013, AMDA released a list of five practices or tests that are common in the post-acute/long-term care (PA/LTC) setting, but lack scientific evidence to support their use. Today, at AMDA’s 2015 Annual Conference, another five practices (6-10 below) or tests to question were released.

1. Don’t insert percutaneous feeding tubes in individuals with advanced dementia. Instead, offer oral assisted feedings.
2. Don’t use Sliding Scale Insulin for long-term diabetes management for individuals residing in the nursing home.
3. Don’t obtain a urine culture unless there are clear signs and symptoms that localize to the urinary tract.
4. Don’t prescribe antipsychotic medications for behavioral psychological symptoms of dementia (BPSD) in individuals with dementia without an assessment for an underlying cause of the behavior.
5. Don’t routinely prescribe lipid-lowering medications in individuals with a limited life expectancy.
6. Don’t place an indwelling urinary catheter to manage urinary incontinence.
7. Don’t recommend screening for breast, colorectal or prostate cancer if life expectancy is estimated to be less than 10 years.
8. Don’t obtain a C. difficile toxin test to confirm “cure” if symptoms have resolved.
9. Don’t recommend aggressive or hospital-level care for a frail elder without a clear understanding of the individual’s goals of care and the possible benefits and burdens.
10. Don’t initiate antihypertensive treatment in individuals
“More than 70 specialty societies have joined Choosing Wisely, and many, like AMDA, are expanding on their original lists of overused tests, treatments and procedures clinicians and patients should talk about,” said Daniel Wolfson, Executive Vice President and Chief Operating Officer of the ABIM Foundation. “The more than 350 collective recommendations from our Choosing Wisely partners illustrates the pervasiveness of unnecessary care in our health care system, and it’s through the leadership of organizations like AMDA that we are making real progress to reduce waste and improve care for patients across the country.”
